

Do power companies have energy storage requirements

Overview

Each company must invest in infrastructure that can efficiently support energy storage systems like batteries and thermal storage. This requires comprehensive planning and a thorough understanding of technology that facilitates energy capture, retention, and distribution. Why are energy storage resources important?

Energy storage resources have become an increasingly important component of the energy mix as traditional fossil fuel baseload energy resources transition to renewable energy sources. Currently 23 states, plus the District of Columbia and Puerto Rico, have 100% clean energy goals in place.

What is electrical energy storage (EES)?

Electrical Energy Storage (EES) refers to systems that store electricity in a form that can be converted back into electrical energy when needed. 1 Batteries are one of the most common forms of electrical energy storage.

What are the different types of energy storage policies?

Approximately 17 states have adopted some form of energy storage policies, which broadly fall into the following categories: procurement targets, regulatory adaption, demonstration programs, financial incentives, and consumer protections. Below we give an overview of each of these energy storage policy categories.

How many battery energy storage projects are there?

The U.S. has 575 operational battery energy storage projects 8, using lead-acid, lithium-ion, nickel-based, sodium-based, and flow batteries 10. These projects totaled 15.9 GW of rated power in 2023 8, and have round-trip efficiencies between 60-95% 24.

How are battery energy storage resources developed?

The most significant battery energy storage resource development has

occurred in states that have adopted some form of incentive for development, including through utility procurements, the adoption of favorable regulations, or the engagement of demonstration projects.

What is the economic value of energy storage?

One study found that the economic value of energy storage in the U.S. is \$228B over a 10 year period. 27 Lithium-ion batteries are one of the fastest-growing energy storage technologies 30 due to their high energy density, high power, near 100% efficiency, and low self-discharge 31. The U.S. has 1.1 Mt of lithium reserves, 4% of global reserves. 32
