

# North American energy storage charging station costs

### **Overview**

How much does charging infrastructure cost?

These charging infrastructure costs are approximately 25% for hardware, 50% for labor, 20% for materials, and 5% for permits. Infrastructure costs are relatively modest—and steadily decrease—on a per-electric-vehicle basis. Costs for public charging infrastructure decrease substantially on a per-electric-vehicle basis.

How much does a networked Charger cost?

We use an average cost across all studies and apply a 3% per year reduction in hardware cost. To give examples of some of the underlying studies, the total installed costs ranged from \$650 in the Rocky Mountain Institute study to \$2,423 for a networked charger as assessed by Avista Utility.

How far away should a charging station be from a freeway?

Charging stations will also no longer be required to be less than 50 miles apart — a concern for some large rural states — or within a mile of a freeway. States will have more discretion on charger locations. The DOT didn't respond to NPR's requests for an interview.

Why are installation costs mainly a function of the number of Chargers?

Similar to Level 2 charging, installation costs per charger fall as more chargers are installed per site. Also, costs do not rise proportionally with power so a charger with triple the power does not result in triple the cost. Hence, installation costs are mainly a function of the number of chargers per site.

What are the cost drivers of charging infra-structure hardware?

Public and workplace charging infra-structure hardware costs include the charger and its pedestal. The main cost drivers are the power of the unit, in kW; whether it requires a pedestal; and whether it is networked with communication or payment gather-ing capability.

How many public chargers are needed in 2025?

4 times more public charging infra-structure than was in place in 2017 is needed by 2025 to match expected electric vehicle market growth. The analysis finds that at least 100,000 public and workplace chargers will be needed across the 100 most populous U.S. metropolitan areas over 2019–2025.
